WEEK 1 - AI WORKFLOW MAP

1. PROJECT INFORMATION

Niche	Market Place
Project Name	ShopHive
Project Type	E-MarketPlace
Project Description	ShopHive is a Nigerian online marketplace that helps fashion businesses manage products,customer orders,payments and sales through one organized digital platform.

2. FIVE-STAGE AI-ASSISTED WORKFLOW

The workflow takes **ShopHive** from the initial product structure through visual design, interactive prototyping, publishing and finally development of a functional application.

Stage	Objective	Tool / Platform	How I Will Use It	Why I Chose It
1. Structure	Define the product structure and requirements.	ChatGPT/Claude	Define target users, user needs, key features, information architecture, user flows, and product requirements.	It can help organize a complex product idea into clear requirements and user journeys before visual design begins.
2. Concept	Develop the visual direction and initial interface concepts.	Figma AI	Explore layout ideas, generate initial UI directions, and refine the visual approach for the marketplace.	It can speed up design exploration while keeping the work within a familiar UI/UX design environment.
3. Prototype	Create a high-fidelity interactive prototype.	Figma	Design key screens such as onboarding, home, product listing, product details, cart, checkout, order tracking, and seller dashboard, then connect them into a clickable prototype.	Figma supports detailed UI design, components, responsive layouts, collaboration, and interactive prototyping.
4. Publish	Make the approved product experience accessible online.	Framer/Netlify	Use the approved design direction to create and publish a responsive web experience that can be shared with users and stakeholders.	Framer allows a polished responsive website to be published quickly and makes it easy to share the result for feedback.
5. Full App	Turn the validated	Lovable	Translate the	It can accelerate

	concept into a functional application.		approved requirements, flows, and interface direction into a functional web application, then test and refine the core marketplace features.	application development from structured requirements while allowing the product to be iterated quickly.

3. WORKFLOW AT A GLANCE

STRUCTURE → CONCEPT → PROTOTYPE → PUBLISH → FULL APP

4. EXPECTED OUTPUT FROM EACH STAGE

- **Structure:** A clear product brief, user flow, feature list, and information architecture.
- **Concept:** Initial visual direction and interface concepts.
- **Prototype:** A clickable high-fidelity Figma prototype covering the main user journeys.
- **Publish:** A shareable responsive web experience for feedback and validation.
- **Full App:** A functional application with the core marketplace experience implemented.
