Sitemap location: Page "08 Sitemap" in the Figma file. Wireframes are on pages 02 to 07.

Tool used

I used Claude (an AI assistant) connected to Figma, to generate the sitemap and the first version of the wireframes from a short written prompt. I then did my editing by hand in Figma.

Prompt and result

My prompt described a multi-vendor marketplace app for Nigerian buyers, covering onboarding, browsing, checkout and orders. The AI produced a sitemap with 6 sections and 52 mobile screens: Onboarding & Auth, Home & Discovery, Product & Cart, Checkout & Payment, Orders & Account. It then turned the sitemap into wireframe screens.

What I edited by hand

Screen	AI first pass	My edit
Splash	Generic white square logo with a store icon; placeholder name "Flexisaf Market" taken from the file title	Custom ShopHive logo (cart in a hexagon with a bee detail) and wordmark; kept green background and tagline
Welcome	2x2 grid of tinted tiles with abstract line icons (package, tag, store, truck)	Replaced the icons with real product photos (sneaker, headphones, shirt, perfume) on soft tinted tiles

- **Splash screen.** I replaced the logo and the app name with my own ShopHive brand identity.
- **Welcome screen.** I replaced the abstract icons with real product photography.

Why the AI's first structural pass wasn't quite right

The structure itself was correct: the right screens, in a sensible order, grouped into logical sections. What it could not give me was identity and real content, and those are what make a design feel finished.

- **Splash screen:** The AI used a stock icon and a name taken from my file title. It looked like a template and said nothing about what the marketplace is. A splash screen exists to establish the brand, so a placeholder logo defeats its purpose.
- **Welcome screen:** The layout was right (visual, headline, primary action, secondary action, guest option), but abstract icons such as a truck or a tag do not show a new user what they can buy. Real

products show the range of categories (fashion, electronics, beauty) at a glance and make the app feel like a real store.

What I learned

AI is fast at structure: it gave me a complete sitemap and a full set of screens in minutes. The human step is adding specificity, such as brand, real imagery and judgment about what the first-time user needs to see. In the next round I would also tighten the empty space on the Welcome screen, between the description and the buttons.
